EM+TV and SART+TV for image reconstruction

Ming Yan University of California, Los Angeles

May 17, 2010

1 Radon Transform

In order to use algebraic reconstruction methods, we have the following system of linear equations,

$$Ax = b, (1)$$

here, A is the matrix defining the radon transform, x is the image, and b is the measurements. The problem is to reconstruct x from b. The matrix A can be derived by Siddon's algorithm. For constructing A, there are many articles on this, we will skip this for this time. For 3D image reconstruction, the matrix A will be very large, and it is unable to store it. We have to define two functions one is Ax, another is A^Ty .

$2 \quad \text{EM+TV}$

For EM(Expectation Maximization)+TV(Total Variation), we assume that the noise in the measurements are poisson noise and independent. Then

$$P(b|Ax) = \prod_{i=1}^{M} e^{-a_i x} \frac{(a_i x)^{b_i}}{b_i!},$$
(2)

where a_i is the i^{th} row of A.

The optimization problem is

$$\underset{x}{\text{minimize}} \int |\nabla x| - \alpha \log P$$
subject to $x \ge 0$, (3)

here ∇x is a vector, and each component is a linear operation on x. When we use ∇ , we consider x to be 2D or 3D image. Otherwise, x is considered to be a vector, except stated.

Plugging into the probability gives us

$$\underset{x}{\text{minimize}} \int |\nabla x| + \alpha \sum_{i=1}^{M} (a_i x - b_i \log(a_i x))$$
subject to $x \ge 0$. (4)

The KKT condition of this is

$$-\operatorname{div}(\frac{\nabla x}{|\nabla x|})_{j} + \alpha \sum_{i=1}^{M} (a_{ji}(1 - \frac{b_{i}}{a_{i}x})) - y_{j} = 0 \qquad j = 1, \dots, N$$
 (5)

$$y \ge 0 \tag{6}$$

$$x \ge 0 \tag{7}$$

$$y^T x = 0. (8)$$

It becomes

$$-\frac{x_j}{a_i^T \overrightarrow{1}} \operatorname{div}(\frac{\nabla x}{|\nabla x|})_j + \alpha \frac{\sum_{i=1}^M (a_{ij}(1 - \frac{b_i}{a_i x}))}{a_i^T \overrightarrow{1}} x_j = 0 \qquad j = 1, \dots, N.$$
 (9)

OI

$$-\frac{x_j}{a_i^T \overrightarrow{1}} \operatorname{div}(\frac{\nabla x}{|\nabla x|})_j + \alpha x_j - \alpha \frac{\sum_{i=1}^M (a_{ij}(\frac{b_i}{a_i x}))}{a_i^T \overrightarrow{1}} x_j = 0 \qquad j = 1, \dots, N. \quad (10)$$

Here a_j is the j^{th} column.

Denote

$$x_j^{EM} = \frac{\sum_{i=1}^{M} (a_{ij}(\frac{b_i}{a_i x}))}{a_i^T \vec{1}} x_j$$
 (11)

and this is the EM update.

The KKT condition becomes

$$-\frac{x_j}{a_j^T \overrightarrow{1}} \operatorname{div}(\frac{\nabla x}{|\nabla x|})_j + \alpha x_j - \alpha x_j^{EM} = 0 \qquad j = 1, \dots, N,$$
 (12)

and this is the optimality for a TV minimization problem. We can solve it by iterations. For this step, we consider this to be 2D or 3D image. For 2D, we have the new notations $u_{i,j}$.

This is nonlinear equation, so we consider a linearized version

$$-\frac{u_{i,j}^n}{V_{i,j}} \frac{u_{i+1,j}^n - u_{i,j}^{n+1}}{\sqrt{\epsilon + (u_{i+1,j}^n - u_{i,j}^n)^2 + (u_{i,j+1}^n - u_{i,j}^n)^2}}$$
(13)

$$+\frac{u_{i,j}^n}{V_{i,j}} \frac{u_{i,j}^{n+1} - u_{i-1,j}^n}{\sqrt{\epsilon + (u_{i,j}^n - u_{i-1,j}^n)^2 + (u_{i-1,j+1}^n - u_{i-1,j}^n)^2}}$$
(14)

$$-\frac{u_{i,j}^n}{V_{i,j}} \frac{u_{i,j+1}^n - u_{i,j}^{n+1}}{\sqrt{\epsilon + (u_{i+1,j}^n - u_{i,j}^n)^2 + (u_{i,j+1}^n - u_{i,j}^n)^2}}$$
(15)

$$+\frac{u_{i,j}^n}{V_{i,j}} \frac{u_{i,j}^{n+1} - u_{i,j-1}^n}{\sqrt{\epsilon + (u_{i+1,j-1}^n - u_{i,j-1}^n)^2 + (u_{i,j}^n - u_{i,j-1}^n)^2}} + \alpha u_{i,j}^{n+1} - \alpha u_{i,j}^{EM} = 0$$
(16)

The code for EM update is as follows:

```
function x = EMCT(A, b, x0, max_iter)
[m, n] = size(A);
x = x0;
stopc = 0;
iter = 0;
sumA = sum(A);
while ~stopc
    Ax = A*x;
    bAx = b./Ax;
    AtAx = A'*bAx;
    x = x.*AtAx./sumA;
    iter = iter + 1;
    if iter == max_iter \mid \mid max(abs(A*x-b)) < 1e-8
        stopc = 1;
        fprintf('total iteration %d:\n', iter);
    end
end
   The code for TV update
function u_new = WDenoiseP(f, V, alpha, max_iter)
[M, N] = size(f);
epi2 = 1e-8;
u = f;
for j =1:1:max_iter
 for i=2:1:M-1
    for j=2:1:N-1
        {\tt c1(i,j)=u(i,j)/sqrt(epi2+(u(i+1,j)-u(i,j))^2+(u(i,j+1)-u(i,j))^2)/V(i,j);}
    end
end
for i=2:1:M-1
    for j=2:1:N-1
        c2(i,j)=u(i,j)/sqrt(epi2+(u(i,j)-u(i-1,j))^2+(u(i-1,j+1)-u(i-1,j))^2)/V(i,j);
    end
end
for i=2:1:M-1
    for j=2:1:N-1
        c3(i,j)=u(i,j)/sqrt(epi2+(u(i+1,j)-u(i,j))^2+(u(i,j+1)-u(i,j))^2)/V(i,j);
    end
end
for i=2:1:M-1
    for j=2:1:N-1
         {\rm c4(i,j) = u(i,j)/sqrt(epi2 + (u(i+1,j-1) - u(i,j-1))^2 + (u(i,j) - u(i,j-1))^2)/V(i,j);} \\
    end
end
```

```

3 SART(Simultaneous Algebraic Reconstruction Technique)+TV

Instead of poisson noise, if we assume that the noise is a weighted gaussian noise. Longer the line travels in the object, higher the standard deviation of the measurements. Define

$$w_i = A_{i,+} = \sum_{j=1}^{M} a_{i,j}, \tag{17}$$

$$v_j = A_{+,j} = \sum_{i=1}^{N} a_{i,j}.$$
 (18)

In addition V and W are diagonal matrices with diagonal element v_j and w_i . The problem is

$$\underset{x}{\text{minimize}} \int |\nabla x| + \alpha \sum_{i=1}^{M} w_i^{-1} (a_i x - b_i)^2.$$

This is an unconstraint problem, and the solution should satisfy

$$-\operatorname{div}(\frac{\nabla x}{|\nabla x|}) + 2\alpha A^T W^{-1}(Ax - b) = 0.$$
(19)

If we denote

$$x^{SART} = x - V^{-1}A^{T}W^{-1}(Ax - b)$$
 (20)

we have

$$-\operatorname{div}(\frac{\nabla x}{|\nabla x|}) + 2\alpha V(x - x^{SART}) = 0. \tag{21}$$
